Components when and when not to!

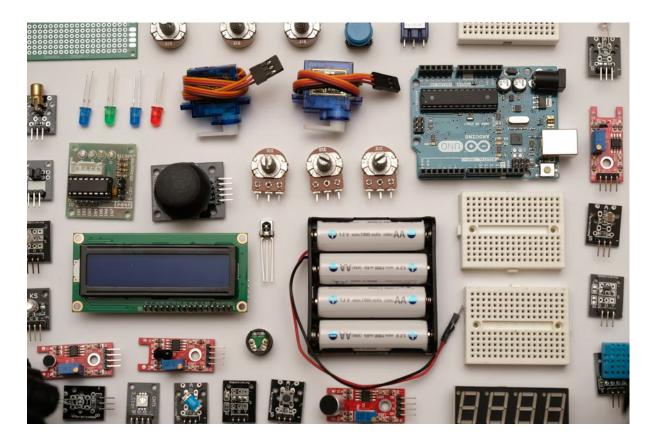

The Golden Rules of when to break up your components up into smaller ones.

1) When sharing the code and reusing is not easy.
2) When you have performance issues.
3) When your state is not manageable.
4) When you need to test certian edge case.
5) When working on a code base with many developers.
6) Using a third part lib.
7) When imperative and declarative coding styles clash.

IF THERE ISN'T A NEED DONT DO IT… Building Abstraction has it's cost!
